Operating model

Operations runs on three support zones: business hours, after-hours, and emergency. During business hours, the service desk owns requests; after-hours issues route to the on-call lead. Emergency changes require a follow-up note within one business day.

Release cadence

Weekly releases land on Thursday after the change freeze lifts. Every release note records the owner, rollback steps, and the user-facing impact. Hotfixes are allowed only if a production incident is active or a customer-facing blocker is confirmed.

Change control

Standard changes need one approver, normal changes need two approvers, and high-risk changes need an incident review first. Each change ticket includes scope, rollback plan, testing evidence, and a comms owner.

Vendor support

Vendor outages are tracked in the support backlog. The vendor owner updates status twice per day until resolved. If a vendor misses the SLA twice in a quarter, the account is escalated to procurement.

Data handling

Operational logs are retained for thirty days, audit exports for one year, and incident notes for two years. Do not paste customer secrets into chat. Shared screenshots must blur personal data before upload.

Weekly checklist

Review the support queue, verify backups, close stale incidents, and confirm the on-call calendar. The checklist is complete only after the ownership board is updated and the release manager signs off.
